GALVANIZED

MILL FINISH

SlipNOT® is produced in a standard mill finish. There are no additives or paints applied to the product besides the slip resistant coating. Mill finish will be the raw material color.

POWDER COATED

Powder coating has evolved as a popular dry finishing process used as a protective layer on metal products. It is becoming the preferred finish over traditional painting, providing durability and resistance to corrosion, chemicals, and weather elements. Unlike wet paint, powders don't run or drip, providing a more uniform coating. The vibrancy of powder coated parts tend to stay bright and fresh longer than wet paint.

PAINTED

SlipNOT® products can be painted, however, care must be taken in order not to compromise slip resistant properties of the surface. Standard paint is available in black. Custom options are safety yellow and gray upon request. For specialized applications, please contact a *SlipNOT*® representative for priming and painting guidelines.

GALVANIZED

SlipNOT® steel products can be offered with a hot-dipped galvanized finish to prevent corrosion. Galvanizing is performed in accordance with ASTM A123 or other appropriate specifications.
